and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as th template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting onset of diabetes mellitus comprises detecting specific gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method using a mutation in the CD38 gene (involved in the production of cyclic ADP-ribose (CADPR)), to detect the onset of diabetes mellitus. The method is useful for detecting the onset of diabetes mellitus. The present sequence represents a PCR primer for human CD38, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                       Human; CD38; diabetes mellitus; detection; cyclic ADP-ribose; CADPR;

The invention relates to a mammalian PGI gene and protein, and a set of PGI biallelic markers. The PGI polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a nucleotide at a PGI-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Sally-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant procedure which would enable early-stage diagnosis. The PGI gene can be used for and curative treatments of the disease. The PGI gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease.
                                                                                                                PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                This invention relates to the DNA and protein sequences of a novel human Ekbp protein 12.87. The invention also comprises a method for producing the polypeptide by recombinant DNA technology. The polypeptide is useful in treating malignant tumours, haemopathy, human immunodeficiency virus infection, immunological diseases and various inflammations. Also disclosed in the invention is an antagonist to the fkbp protein and a method for its use. The present sequence represents a reverse transcriptase (RT) PCR primer used to isolate the human fkbp 12.87 cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The method can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA sequence analysis; sequencing; protein sequence; protein structure; gene typing; organ donation; bacteria identification; 16s rRNA; HLA; human leukocyte antigen; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such a class 1/2 HLA comprises identifying all possible nucleotide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The PUR sequence can be used to identify chemical or biological compounds that bind to PUR or binding fragments of PUR. Inhibitors of PUR activity may be used to treat hyperproliferative diseases such as cancer.

```

```
This is the nucleotide sequence of an oligonucleotide used as a competitor with the PUR element in the method of the invention, involving the use of the PUR protein and its fragments, which inhibit PUR protein binding to PUR element or other proteins. Inhibitors of PUR activity may be useful for treating viral infections and hyperproliferative diseases such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PUR element; PUR-alpha; hyperproliferative disease; cancer; human; monoclonal antibody; identification; characterisation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel method (M1) for inserting a nucleic acid (M1) into a circular vector (V1) comprising joining ends of N1 and V1 under a first nucleic acid concentration, melting hybridized cohesive circularization ends, and reannealing the ends at a second concentration. The methods are useful for the cloning small amounts of nucleic acids and forming genomic libraries of complex populations of DNA or CDNA. The methods allow the cloning of minute amounts of uncleic acids efficiently and avoids the size selection problems of prior art systems. Larger nucleic acid fragments are just as easily cloned, allowing highly
                                                                                                                              The present invention describes a monoclonal antibody that specifically binds to an epitope of the PUR protein. Antibodies that bind to the PUR protein and neutralise PUR activity may be used to treat hyperproliferative diseases such as cancer. PUR antibodies may be used diagnostically to detect aberrant expression of the PUR protein and/or mutations in the PUR spec. The present sequence represents an oligomucleotide used in the cloning and sequencing of the PUR protein and its sequence element PUR repeat, in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inserting a nucleic acid into a circular vector comprising joining their ends, melting, and reannealing ends at two different concentrations, useful for cloning small amounts of nucleic acids and forming genomic libraries
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               acid (NI) into a circular vector (VI) comprising joining ends of NI and VI under a first nucleic acid concentration, melting hybridized cohesive circularization ends, and reannealing the ends at second concentration. The methods are useful for the cloning small amounts of nucleic acids and forming genomic libraries of complex populations of DNA or CDNA. The methods allow the cloning of minute amounts of nucleic acids efficiently and avoids the size selection problems of prior art systems. Larger nucleic acid fragments are just as easily cloned, allowing highly expresentative libraries to be made. Vector to vector ligation is avoided using the methods. AA40351-A40366 represents primers used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an nucleic acid. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) for thymidine (T) rich. The method is used to vaccinate subjects and/or orthowyxoviridae), bacterial antigens (e.g. herpesviridae, retroviridae and/or orthowyxoviridae), bacterial antigens (e.g. toxoplasma, staphylococcus), fungal antigens and/or present antigens and/or preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a limmune cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, and/or crampylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parastic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a immune deficiency. The present sequence can also be used to redirect a rock the present sequence may have a phosphorothicate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccine, cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; fungal infection; parasitic infection; cancer; asthma; infectious disease; allergy; immune deficiency; phosphorothioate; ss.

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Bscherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer; cytostatic; carcinogen; pharmacodyanamic marker;
                                                                                                                                                                                                                                                                                                  Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABY00010-ABY62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a
                                                                                                                                                                                                  Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                              (d) assessing the efficacy of a therapy for inhibiting prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (I) is also useful as a pharmacodyanamic or pharmacogenomic marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antianglogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antianglogenic nucleic acids, and instructions for administering the a subject having a condition characterised by unwanted anglogenesis. The method is useful for inhibiting angiogenesis associated with solid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, mecular degeneration, corneal graft rejection, neovascular glaucoma mecular degeneration, conneal graft rejection, neovascular glaucoma methologis, only solid sia, rubeosis, older webber Syndrome, mycardial angiogenesis plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions.
                                                                                                                                                                                                                                                                    Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibiting angiogenesis in a subject, involves administering at least

The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule.

Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis.

The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthitis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, oller-Webber Syndrome, myocardial angiofibroma, wound granulation, intestinal adhesions, cionis, atherosclerosis, scleroderma and hypertrophic scars. The present consists of the contestion intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the detection of multiple components in a medium, comprising combining the medium with at least two sensitiser reagents, and at least one reactive reagent activated by a product generated by the sensitiser reagents when activated; and differentially activating the sensitiser reagents. The combination of sensitiser reagents and reactive reagent(s) allows differential detection of the components. Methods of the invention may be used for the detection of ligands, receptors and polynucleotides, and also for the detection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of multiple analytes, e.g. ligands, receptors, polynucleotides and pollutants, involves adding a combination of sensitiser reagents and reactive reagent actuatable by a product of the
                        a subject having a condition, characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retroolental fibroplasia, rubeosis, Osler Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telanglectasia, haemophiliac loints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention represents a method for detecting the presence of a polynucleotide sequence, differences in polynucleotide sequences or mutations in genomic DNA. The method involves contacting 3 oligonucleotide probes with a sample containing a polynucleotide. The first probe hybridises to a region of the polynucleotide sequence and the second and third probes can bind a second region of the polynucleotide sequence. The second and third probes are identical except for the presence or difference of one or more nucleotides. The reaction medium is then subjected to conditions for forming substantially non-dissociative termolecular complexes, which can be at least one of,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphism detection; sequence detection; mutation detection; A24; probe; non-dissociative termolecular complex; dopTAR sensitiser particle; single nucleotide polymorphism; SNP; ss.
e.g. cells, various drugs, metabolites, pesticides (e.g. polyhalogenated biphenyls, phosphate esters, thiophosphates, carbamates and polyhalogenated sulfenamides) and pollutants. Methods of the invention allow the detection of multiple analytes in a single test medium. An application of the methods of the present invention would be in the field of clinical diagnostics. The current sequence represents A24 oligonucleotide for the creation of oligonucleotide coated
                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A24 oligonucleotide used to create dopTAR chemiluminescer particles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting presence of polynucleotide, differences between polynucleotide sequences, useful for detecting single nucleotide polymorphism and alleles of polynucleotide sequence involves use of

the polynucleotide sequence with the first and second probes or the polynucleotide sequence with the first and third probes. The oligonucleotide probes have labels non-covalently bound to allow for their detection upon binding. The method of the invention is useful for detecting the presence of a single nucleotide polymorphism (SNP) in a fragment of genomic DNA. The method can be used for the direct detection of nucleic acid in very small quantities without amplification. In addition, the method may be carried out with amplification of the target probe A24 used to create doppha chimiluminescer sensitiser particles in the method of the invention. Binding the nucleic acid to a suspendable polynucleotide target from the bulk solution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to generating mRNA-cDNA hybrids, comprising

(a) providing a solution containing a nucleic acid template, one or more primers complementary to the sense conformation of the nucleic acid template, and one or more promoter-linked primers complementary to the antisense conformation of the nucleic acid template, and with an RNA promoter, (b) treating the nucleic acid template with the one of more primers to synthesise a first cDNA strand, (c) treating the first cDNA strand with one or more promoter-linked primers to synthesise a promoter-linked double-stranded nucleic acid, (d) treating the promoter-linked double-stranded nucleic acid, (d) treating the promoter-linked clouble-stranded nucleic acid, (e) treating the mRNA fragments and (e) treating the mRNA fragments with one or more primers to synthesise treating or preventing microbe related genes, comprises thermocycling steps of promoter-linked double-stranded cDNA or RNA synthesis Generating mRNA-cDNA hybrids for suppressing cancer-related genes, Example 5; Page 26; 53pp; English.

mRNA-cDNA hybrids by reverse transcription of the amplified mRNA fragments. The method is useful for preparing high amounts of pure and fragments. The method is useful for preparing high amounts of pure and specific mRNA-cDNA hybrids for transducing biological effects of interest in vitro as well as in vivo, for inhibiting gene function in prokaryotes and eukaryotes in vivo, for inhibiting gene function in carcarded genes, in tracting or preventing microbe related genes, in studying candidate molecular pathways with systematic knock out of involved molecules, in high throughput screening of gene functions in physiological conditions. The mRNA-cDNA hybrids may be used to in physiological conditions. The mRNA-cDNA hybrids may be used to screen for special gene functions, for manipulating gene expression in vitro, and for designing therapy for genetic diseases in vivo. The cDNA part of a D-RNAi (DNA-RNA interference) can be modified by nucleotide ransfected probe activities. The RdRA (RNA dependent RNA polymerase) errorparation to increase the stability and effectiveness of transfected probe activities. The RdRA (RNA dependent RNA polymerase) compared to ds-RNA duplexes. The RdRA dependent RNA provides further antisense gene knockout activity in addition to the posttranscriptional gene silencing (PTGS) mechanisms of the sense-RNA template, resulting in multiple specific gene interference effects with one probe. The present sequence is a poly (dT) PCR primer used in the series of the series. first strand cDNA in the method of the invention

                                                                                                                                                        The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression
                                                                                                                                                                                                                                                      of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, cervical cancer, eye cancer, kidney cancer, larynx cancer, levkaemia, liver cancer, ind cancer, hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, pancreatic cancer, proceste cancer, independence, ovarian cancer, stomach cancer, resticular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in
of
surface antigens and antibodies to a subject having or at risk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 24;

A nucleic acid sample comprising oligonucleotide 2006 was administered to a mouse model by an oral route or a vehicle control. Colonisation of mice by Heliobacter pylori was assessed at time points from 1 day to 1 month after treatment. The ability of the nucleic acid to reduce H. pylori colonisation was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Prevention or treatment of gastric ulcer involves administering nucleic
Gastric ulcer treatment immunostimulatory nucleic acid #148.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 14; 45pp; English.

o,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes immunostimulatory nucleic acids of 14-100 nucleotides in length comprising the formula 5' XIDCGHX2 3' (I), where XI or X2 = independently any sequence 0-10 nucleotides; D = nucleotide other than C; C = cytosine; G = guaine; H = nucleotide other than G. The immunostimulatory nucleic acid further comprises a sequence consisting of P and N positioned immediately 5' to XI or 3' to X2 and N is a B cell neutralising sequence, where N begins with a CGG trinucleotide and is at least 10 nucleotides long and P is GC-rich palindrome containing sequence at least 10 nucleotides long. Also described: (I) a pharmaceutical composition comprising the immunostimulatory nucleic acid and a carrier; and (2) treating an allergic condition. (I) has antiallergic activity and
assessed. The method is useful for preventing or treating a gastric ulcer on a subject e.g. human or non-human vertebrate animal including dog, cat, horse (equine gastric ulcer syndrome, EGUS), cow, goat, sheep, pig, rabbit, turkey, chicken, primate, rat and mouse. The method effectively treats or prevents gastric ulcers. The present sequence represents an immunostimulatory nucleic acid for the treatment of gastric ulcers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunostimulation; immune response; natural killer cell; interferon; type 1 interferon; IFN; cancer; infectious disease; allergic disorder; immune related disorder; ss.

can be used in gene therapy. (I) can be used for preparing a composition for treating a variety of immune related disorders such as cancer, infectious diseases and allergic disorders. (I) also stimulates the activation of natural killer cells and the production of type 1 interferon (IFN). The present sequence represents an immunostimulatory oligonucleotide, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       novel method of immobilising oligonucleotides to a solid support by incubating in the presence of a salt or cationic detergent e.g. Nacl (50-250 mM, pH 6.0-8.0) or 1-ethyl-3-(3'-dimethyl amino propyl)-1,3 carbodismide hydrochloride (ECD). The oligonucleotides can be capture probes for detection of specific nucleic acids by hybridisation or can be primers for template-dependent extension from the immobilised primers on nucleic acid from a target organism. The method can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligonucleotide biotin-T25 for novel nucleic acid immobilisation method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immobilisation; solid support; salt; cationic detergent; capture probe; hybridisation; primer; template-dependent extension; target organism; sequencing; genetic polymorphism; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            on nucleic acid from a target organism. ALE MINIOUS acid from a seays, sequencing and analysis of genetic polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotides AAQ95959-82 are examples of oligonucleotides used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immobilising synthetic nucleic acid on solid support - by incubation in presence of salt or cationic detergent, for use in hybridisation assays, sequencing and analysis of polymorphism

Napl inhibits apoptosis. The protein can be used in the investigation, diagnosis and treatment (e.g. by gene therapy) of Alzheimer's disease.

                                                                                                                                                                                                                  Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such as class 1/2 HLA comprises identifying all possible nucleotide sequences of specific length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA sequence analysis; sequencing; protein sequence; protein structure; gene typing; organ donation; bacteria identification; 16s rRNA; HLA; human leukocyte antigen; PCR primer; ss.
                                                                                                                                                                                                                                                                                                       The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The isolated sequences are useful for enzymatic amplification. (I) is capable of rapidly binding nucleic acids in the sample and placing them in close proximity to target probes on the reagent, thus enabling binding under low stringency. Combination of rapid capture and concentration of polynucleotides with selective targeting of analyte molecules, greatly enhances the isolation process. Non-ionic morpholino oligomers used as probes are not extended by polymerases and therefore

                                                                                                                                    The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such a class 1/2 HLA comprises identifying all possible nucleotide sequences of specific length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        detection; probe; target nucleic acid; enzymatic amplification;

It is used in the method of the invention. The specification describes the use of non-nucleoside spacers to immobilise an array of capture probes on a solid support. The solid support carries an array of capture probes, each consisting of non-nucleoside spacers plus an oligonucleotide to which a nucleic acid-protein fusion or ribosome display particle is bound. Non-nucleoside spacers prevent interaction of proteins with the support surface, ensuring efficient hybridisation between capture probes and bound nucleic acid/protein fusions, while minimising denaturation of the protein which may then adopt its native folded structure. The arrays of capture probes are
do not interfere with amplification of target molecule. AAA39316 to AAA39316, represent oligonucleotides used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Attaching capture probes to solid phases through non-nucleic spacers, producing arrays for detecting interactions of proteins with other
                                                                                                                                                        Gaps

The invention relates to a method of preparing a controlled pore glass-polytetrafluoroethylene (PTFE) resin chromatography membrane, comprising controlled pore glass and an aqueous dispersion of PTFE to form a paste-like mass, heating the paste-like mass at 50-70 plus oC, calendering to form a foldable sheet, and sintering the sheet to produce a rigid, porous sheet. The method prepares a controlled pore glass-PTFE resin chromatography membrane for use in various biotechnical procedures. The membrane is useful in place of controlled pore glass as a support for the synthesis, isolation, and purification of nucleic acids and for the tisolation and purification of proteins. The method produces a membrane that may be used in lieu of controlled pore glass. The present sequence represents an oligonucleotide prepared on the membrane in an example which demonstrates the method of the invention.
                                                                                                                                                                                                                                        Glass-synthetic resin membrane; pore glass-polytetrafluoroethylene resin; chromatography membrane; PTFE; ss.
                                                                                                                                                                                                           Example oligonucleotide #2 prepared on glass-synthetic resin membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Preparation of controlled pore glass-polytetrafluoroethylene resin chromatography membrane by heating, calendering and sintering mixture of controlled pore glass and aqueous dispersion of polytetrafluoroethylene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·.

A method for the analysis of cDNA comprises (a) preparing an angaregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                cDNA and gene expression - by amplification of mRNA digestion with restriction enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1.6%; Score 17.4; DB 1; Length 1 94.7%; Pred. A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primer she for second carbon and a plural type of labelled reverse transcription primer she from the mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes
                                                                                                                                                                                                                                                  cDNA and gene expression - by amplification of mRNA digestion with restriction enzymes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate (c DNAs in separate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Insulin-like growth factor binding protein-5; IGFBP-5; human;

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENBSEQ files AAQ75547_Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.
                                                                                                                                                   digestion with restriction enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 21 BP; 1 A; 1 C; 2 G; 17 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents an antisense oligomucleotide targeted against human insulin-like growth factor binding protein-5 (IGFBP-5). The invention relates to a composition for treatment of hormone-regulated cancer, comprising an antisense oligomucleotide (such as this sequence) which inhibits expression of IGFBP-5 by hormone-regulated tumour cells. The compositions is useful for delaying progression of hormone-regulated androgen-independent state, by treating hormone sensitive tumour cells with the antisense sequence which inhibits expression of IGFBP-5 by the tumour cells. The composition can also be used for treating a hormone-responsive cancer in an individual, and administering the composition to the individual after initiation of hormone-withdrawal to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                             Composition for treating hormone-regulated cancer, e.g. breast and profetatic tumoures, comprising an antisense oligomucleoride that inhibits expression of ingulin like growth factor binding protein-5 by hormone-regulated tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          induce apoptotic cell death of hormone-responsive tumour cells, and therefore delaying the progression of hormone-responsive cancer cells to anhormone-independent state in the individual. It can also be used for inhibiting or delaying metastatic boney progression of an IGF-1 sensitive tumour in a mammal, by administering the composition to inhibit the expression of IGFBP-5 by the hormone-responsive cancer cells, and therefore inhibiting or delaying metastatic boney
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                           Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes

The method can be used to analyse gene expression
                            A method for the analysis of CDNA comprises (a) preparing an aggregate of double-stranded CDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) alectrophoresing the digested aggregate of cDNAs in seperate lames. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                           Gaps

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ7547-Q758) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The method can be used to analyse gene expression
oue prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.
                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Ξ

```
and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lames. The method can be used to analyse gene expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .,
                                                                                                                                                                                                                                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEE files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) dispersing each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-07598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and, (c) electrophoresing the digested aggregate of cDNAs in Seperate lanes. The method can be used to analyse gene expression

Reverse transcription primer used in cDNA analysis technique.

RESULT 206

à

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75788) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.
                                                                                                                                                                                                                                                                                 by amplification of mRNA enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENSESP files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQTS547-QPS) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75247-07538) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gene expression; reverse transcription; primer; cDNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cDNA and gene expression - by amplification of mRNA digestion with restriction enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Reverse transcription primer used in cDNA analysis technique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQVIS4T-QTS7S) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoreasing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A STATE OF S
                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method for identifying an inhibitor of potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene for an each somethod can be used in the diagnosis, prevention and treatment of LOH disorders, contagned at the casions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZSBA12-ZSBA25

                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of ht serime'threonine protein kinase 48. The sequences can be used in the treatment of cancer and HIV infection. The present sequence is a PCR primer for the coding sequence of the invention.

of a gene is involved in preventing a replication error in a cell. The method comprises providing the cell with a specific inhibitor for the groduct and determining the level of functional expression of a marker gene in the cell, where the level of expression of the marker gene in the cell, where the level of expression of the marker gene is dependent on the occurrence of the replication error. The method is preventing a replication error in a cell. The identified genes are useful for developing diagnostic tools, or as targets for drug development to manipulate cells on the basis of the presence or absence of function of the gene. ABZ21535-36 represents fragments of plasmids used to detect somatic instability, in the course of the invention.
                                                                                            The specification describes a method for determining whether a product

A method has been improved for detecting and characterising mRNA isolacid mRNA includes synthesising a double stranded (ds) cDNA from isolated mRNA, digesting the ds cDNA with a restriction endonuclease to produce cDNA fragments in which at least one end of the cDNA fragments in which at least one end of the cDNA fragments in improvement comprises: (a) hybridising to an adaptor DNA sequence. The one end of the cDNA fragments, (b) ligating the adaptor DNA sequences to the cDNA fragments; (c) amplifying the cDNA fragments having ligated adaptor DNA sequences adaptor bNA sequences of the cDNA fragments; (c) amplifying the cDNA fragments to the ends of the cDNA fragments, where the primers that hybridise to the ends of the cDNA fragments. Detection and characterisation of mRNA by restriction display PCR comprising synthesis of cDNA, digestion with a restriction endonuclease, ligation to an adaptor DNA and PCR amplification Disclosure; Page 24; 40pp; English.

at the 3' end that specifically hybridises to a subset of cDNA molecules; and (d) detecting the presence of the resulting amplified cDNA fragments. The present sequence represent a template poly-A tail used in the present specification. The method designate restriction display PCR can be used for characterising cells based on their mRNA therapeutics that alter cellular gene expression. The method is also useful for characterising cells of a variety of types and under a useful for characterising cells of avariety of types and under a variety of physiological conditions. The method is also useful for identifying cells or tissue from particular individuals or species based on the fingerprint obtained from the mRNA content of isolated cells or tissue and comparing it to cells or tissue from a known source. .; 0 Length 19; 0; Indels 1.6%; Score 17.2; DB 1; 94.4%; Pred. Peptides having at least two new nucleotides - useful as primers in RT-PCR

Example 1; Page 12; 19pp; Japanese.

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X)m5'-(alpha)n-bera-N3'; or (X)m5'-(gamma)k-delta-N3'; where

(X)m5'-(alpha)n-bera-N3'; or (X)m5'-(gamma)k-delta-N3'; where

(M)m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine;

(M)m = adenine, guanine, cytosine or thymine; gamma = thymine;

(M)m = adenine, guanine, cytosine or thymine; gamma = thymine of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to nuclectide sequences encoding spearmint

(')-limonene-6-hydroxylase (L6H) and peppermint (-)-limonene-3-
bydroxylase (L3H). Host cells containing a vector comprising the
nucleotide sequences can be used for the recombinant production of
limonene hydroxylases or of primary enzyme products. The primary enzyme
limonene hydroxylases or of primary enzyme products. The primary enzyme
limonene hydroxylases or of primary enzyme products are trans-carveol in the case of (-)-L6H or
trans-isopiperitenol in the case of (-)-L3H, which are of subsequent use,
to obtain enhanced expression of limonene hydroxylase in plants to attain
enhanced trans-carveol or trans-isopiperitenol production as a predator
contained production as a predator
limonene hydroxylase cDNAs also provide a useful tool for isolating
other monoterpene hydroxylase genes and for examining the developmental
regulation of monoterpene biosynthesis. Sequences AAX06564-73 represent
primers for the PCR amplification of (-)-limonene-6-hydroxylase cDNAs.
                                                                                                                                                                                                                        (-)-limonene-6-hydroxylase; (-)-limonene-1-hydroxylase; L3H; L6H; spear mint; peppermint; enzyme; limonene hydroxylase; trans-carveol; trans-isopiperitenol; pathogen defense mechanism; attractant; environmental signal; monoterpene hydroxylase; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated limonene hydroxylase nucleic acids - which encode limonene-6-hydroxylase and limonene-3-hydroxylase, which can be used to produce trans-carveol and trans-isopiperitenol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1.6%; Score 17.2; DB 1; Length 19; 94.4%; Pred. The present primer was used to reverse transcribe cDNA encoding a C-20 oxidase. The amplifie fragment is used in the method of the invention. The specification describes methods for the inhibition and control of gluberallic acid levels may be inhibited or controlled by use of a chimeric expression construct expressing a RNA or protein which suppresses the gibberallin biosynthetic pathway sequence, products. The methods uses copaly1 diphosphate synthase, and a peta-hydroxylase, 2-oxidase, phycoene synthase, C-20 oxidase, and a leaf to control seed germination and seedling growth especially to regulate gene products of gibberallin biosynthetic pathway and restoration of normal seed germination, in transgenic plants. The products of gibberallin deficient, and have shortened hypocotyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the immune system (e.g. lymphopaenia, leukocyte adhesion deficiency syndrome or haemoglobinuria, anaemia), hyperproliferative disorders (e.g. Gaucher's disease), infectious disease (e.g., herpes simplex), coagulation disorders, blood platelet disorders and autoimmune disorders. The polynucleotide sequence is also used in gene therapy. The present sequence is a 3 sequencing primer used in the identification and characterisation of polynucleotides up-regulated by fatty lesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an isolated nucleic acid regulated by fatty lesion development, which comprises any of 55 polynucleotide sequences from Oryctolagus cuniculus. The polynucleotide, polypeptide or antibody is useful for preventing, treating, modulating or ameliorating a medical condition, particularly atherosclerosis. The invention is used as a marker or detector of nervous system disorder or disease (e.g. Parkinson's disease, Alzheimer's disease, ischaemia, dementia). The invention may also be useful for treating deficiencies or disorders of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotides regulated by fatty lesion development and their encoded polypeptides, useful for preventing, treating or ameliorating atherosclerosis, as well as for immune or hyperproliferative disorders

The present sequence is presents a pixture used to isolate involved mouse microglia and macrophage regulatory gene DST (digital sequence tag) sequences. AAS06401-AAS06590 represent these novel sequences and the primer sequences used to isolate them. The PCR-based total gene expression analysis (TOSA) system is used to examine the expression pattern of molecules corresponding to genes that are regulated in continulated microglia, unstimulated macrophage. The polynucleotides of the invention, the polypeptides are useful for the diagnosis, prevention, treatment or amelioration of a medical condition, preferably a neuroinflammatory pathology or a neurodegenerative disease such as polypeptides are useful for the diagnosis, prevention, treatment or amelioration of a medical condition, preferably a neuroinflammatory pathology or a neurodegenerative disease such as Alzheimer's disease, senile dementia, Parkinson's disease, obsessive depression and bipolar manic-depressive disorder. The sequences and metotious disorders (e.g. ADDS), hyperproblicating or treating contrections disorders (e.g. ADDS), hyperproblication of disorders (e.g. severe combined immunodeficiency, SCID) autoimmune diseases (e.g. insulin dependent diabetes mellitus), infinammatory disorders (e.g. insulin dependent diabetes mellitus), infinammatory disorders (e.g. insulin dependent diabetes mellitus), infinammatory disorders (e.g. arthritis). The polynucleotides can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ·

The present invention describes isolated neuroleptic-regulated nucleic acid molecules. (I) have neuroleptic, antimanic and antidepressant activities, and can be used in gene therapy. (I), polypeptides (II) comprising (I), are useful for encoded by (I), or a host cell (III) comprising (I), are useful for preventing, treating, modulating or ameliorating a medical condition to such as a neuropsychiatric disorder. (I) are useful as diagnostic agents for diagnosting a pathological condition or susceptibility to a schizophrenia, a bipolar disorder or addiction-related behaviour. (I) are useful for detecting the presence of a nucleic acid encoding a protein caseful for detecting the presence of a nucleic acid encoding a protein in a mammalian tissue sample. (I) can be used as probes and primers, for chromosome identification, to control gene expression through triple choiced isometers in the control gene expression through triple above mentioned disorders, indentifying individuals from minute to biological samples, as an alternative to restriction fragment length collymorphism (RPLP) and as polymorphic markers for forensic purposes. (I) is also useful as molecular weight markers on Southern gels, call type, as a probe to subtract-out known sequences in the process of discovering novel polymucleotides, for selecting and making oligomers of for attachment to a gene chip or other support; to ratae anti-out propher and as an anti-out probe and and as an anti-out probe and and as an anti-out probe and as an anti-out probe and and and any probe and and any probe and an anti-out probe and and any probe and an
central nervous system; antidepressant; gene therapy; diagnosis; neuropsychiatric disorder; schizophrenia; bipolar disorder; addiction-related behaviour; chromosome identification; immune response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antibodies using DNA immunisation technique, and as an antigen to elicit an immune response. AAH21877 to AAH21984, AAB98083 and AAB98084 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New neuroleptic-regulated polymucleotides expressed in the central nervous system for diagnosing and treating neuropsychiatric disorders such as schizophrenia, bipolar disorder and addiction-related behavior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Thomas EA, Sutcliffe JG, Pribyl TM, Hilbush B,

Spearmint (-)-limonene-6-hydroxylase PCR primer SEQ ID NO: 18.

WPI; 2002-489107/52

Piller KJ,

```
The present invention provides the protein and coding sequences of the peppermint and spearmint (-)-limonene-3-hydroxylase and the spearmint (-)-limonene-6-hydroxylase. Also provided are a number of probes and PCR primers which were used to isolate the sequences. These are useful in the production of transgenic plants with altered flavour and aroma.
                                                                                                                                                                                                                                                                                                          Novel isolated limonene hydroxylase encoding nucleic acid molecule, useful for altering production of limonene-6-hydroxylase or limonene-3-hydroxylase in suitable host cell -
                                     SS.

The invention relates to control of gibberellin (GA) levels in plants.

The method involves producing transgenic plants having a phenotype of reduced seed germination and early seedling growth, then restoring seed germination and early seedling growth by treating plants with an appropriate compound when conditions are favourable. The method is useful to control seed germination and/or early seedling growth in agricultural production so that unfavorable environmental conditions normally reducing agronomic output can be avoided and yields increased. Plants also demonstrate increased uniformity of permination, emergence and seedling vigor, so increasing yields at harvest. The method is especially useful in crop plants such as e.g. canola, soybean, cotton, etc., and is also useful in storage and transport of seeds to reduce premature germination which may affect agronomic or food quality of the seeds. The present sequence is a per primer is used in the exemplification of the invention Control of gibberellin levels in plants useful to avoid unfavorable conditions in crops to increase yields, using transgenic plants having reduced seed germination and early seedling growth then treatment to Sequence 19 BP; 0 A; 0 C; 0 G; 18 T; 1 other; Example 19; Page 104; 155pp; English. restore these properties

Preventing and treating hepatitis viral infection in a mammal, comprises administering nucleic acid molecules that up- or down-regulate in hepatitis B virus infection or polypeptides encoded by the nucleic acid molecules

```
The present invention relates to a method for preventing, treating, modulating or ameliorating a medical condition. The method involves administering one or more nucleic acid molecules up- or down-regulated in hepatitis B virus (HBV) infection or polypeptides encoded by the nucleic acid molecules or antibodies that bind to the polypeptide. The method is useful for preventing, treating, modulating or ameliorating or a medical condition. It is also useful for determining the presence or alteration in expression of the polypeptide which is useful for the diagnosis of hepatitis viral infection. The method is useful for the assessing the stage of hepatitis viral infection (e.g., acute hepatitis viral infection (e.g., acute hepatitis or therapeutic treatment for hepatitis viral infection and a gene expression profile is useful for identifying polypeptides and polymucleotides which are used in gene therapy and as vaccines. Nucleic acid sequences are consecuted with hepatitis viral infection. Sequences of the invention are useful as a diagnostic markers for HBV infection and for treating infectious diseases. The present DNA sequence is a PCR primer which is useful and product and approach and a general and a product are associated with hepatitis viral infection and for treating infectious diseases. The present DNA sequence is a PCR primer which are also and a product and approach and a product and and a product and

New chimeric polypeptide comprising a histone acetyltransferase polypeptide segment and a segment comprising a histone deacetylase chromatin-associated protein complex subunit, useful for modulating gene expression in cells -

Example 10; Page 54; 85pp; English.

The specification describes chimeric histone acetyltransferase polypeptides. The chimeric polypeptides comprise a polypeptide segment that exhibits histone acetyltransferase activity, and a polypeptide

The present invention relates to a novel simplified TOGA (RTM) method for simultaneous sequence-specific identification of multiple mRNA molecules in a RNA population. The method involves charactrising each of the sequence-specific polymerase chain reaction (PCR) products by partial patterns of gene expression or mechanisms of drug interaction. It is also useful for drug screening, studying physiological processes, genomic The present sequence of diagnostic, prognostic or therapeutic reagents invention.
               histone deacetylase chromatin-associated protein complex. The chimeric polypoptides are useful for determining gene expression profiles in specific cells, for modulating gene expression in specific cells, and for making genetically modified eukaryotes. The present sequence represents a reverse transcription primer used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                 3' sequencing primer #1 used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene expression; drug interaction mechanism; drug screening; primer; genomic mapping; ss.
segment having 40% or greater sequence identity to a subunit of a

The invention relates to polynucleotides and polypeptides associated with atherosclerosis. Polynucleotides of the invention are useful for delivery of genes, DNA vaccines, diagnostic reagents, peptides, for treating nervous system disorders of the invention are useful for treating nervous system disorders (e.g., Alzheimer's disease, continued associated for treating nervous system disorders (e.g., Alzheimer's disease, parkinson's disease, multiple sclerosis, epilepsy), immune disorders (e.g., autoinmune disorders such as rheumatoid arthritis, Addison's disease, haemolytic anaemia, graft-versus-host disease, inflammation), hyperproliferative disorders (e.g., neoplasms) and infectious diseases (e.g., viral, bacterial, fungal or parasite infection). They are used to resensation of tissues, to repair, replace or protect damage tissues, for increasing chemotaxis activity of cells, for increasing chemotaxis activity of cells, for increasing chemotaxis activity of cells, for increasing chemotaxis activity of cells for increasing calls from a lineage, for modulating mammalian characteristics, (such as body weight or height), for modulating mammalian metabolism and storage of energy, to change a mammal's mental or physical state, or as a food additive or preservative. The invention is useful in gene therapy. The modulating is the invent seminarion.
                                                                                                                                                                                                                                                                                                                                Parkinson's disease, multiple sclerosis; immune disorder; gene therapy; autolimune disorder; rheumatoid archritis; hyperproliferative disorder; haemolytic anaemia; graft-versus-host disease; inflammation; infection; epilepsy; Addison's disease; heoplasm; tissue regeneration; chemotaxis; food additive; food preservative; primer; ss.
                                                                                                                                                                                                                                                                                                               Atherosclerosis; vaccine; nervous system disorder; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptide associated with atherosclerosis, useful for treating atherosclerosis, nervous system disorders, immune disorders, hyperproliferative disorders and infectious diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       present sequence is a sequencing primer used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hasel KW;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sutcliffe JG,
                                                                                                                                                                                                                                                                     3' sequencing primer #1 used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 19 BP; 0 A; 0 C; 0 G; 18 T; 1 other;

New ABC1 polypeptide is useful for treating diseases associated with ABC1 biological activity, e.g. Alzheimer's disease, Huntington's disease and cancer -

Examples; Fig 11; 229pp; English.

The invention relates to the human ABC1 cholesterol transporter protein

(B38082) and to nucleic acid sequences (C69120) which encode it. ABC1 is

a member of the ATP-binding cassette (ABC transporter) superfamily of

proteins, and plays a crucial role in cholesterol transport, particularly

intracellular cholesterol trafficking in moncoytes and fibroblasts, being

convolved in cholesterol efflux from the cell. The gene encoding ABC1 is

located on chromosome 9431, and mutations in this gene are associated

with two genetic HDL (high density lipoprotein) deficiency disorders,

Tangier disease (TD) and familial HDL deficiency (FHA). These diseases

care distinguishable in that TD is an autosomal recessive disorder, while

FHA is inherited as an autosomal dominant trait. Low levels of HDL ("good

cholesterol") in the blood correlate with a high risk of cardiovascular

cdisease, particularly coronary artery disease, but also cerebrovascular

characteristic and peripheral vascular disease. cerebrovascular disease, coronary restenosis or peripheral viscular disease. They may also be used in the treatment of disease associated with ABC1 biological activity, such as Alzheimer's disease, Niemann-Pick disease, Huntington's disease, X-linked adrenoleukodystrophy and cancer. The invention specifically excludes proteins with the exact amino acid sequences of GenBank Accession No: CAAl0005.1 and X75926, and the nucleic disease, coronary restenosis, and peripheral vascular disease.

Conversely, a high level of HDL has protective effects against cardiovascular disease. The invention provides genetic constructs and transgenic cells and non-human animals comprising human ABCI nucleic acids, and methods of gene therapy for the treatment or prevention of cardiovascular disease comprising the administration of an expression vector encoding ABCI or an active fragment thereof. The invention also encompasses compounds which mimic ABCI activity, compounds which encompasses compounds which mimic ABCI activity, compounds which stimulate ABCI expression and methods of screening for such compounds. It further relates to methods for determining whether a patient has an increased risk for cardiovascular disease due to polymorphisms in the ABC1 gene. Human ABC1 proteins and nucleotides can be used to treat or prevent cardiovascular disease, especially coronary artery disease,

The molecular array produced by the method of the invention is useful for identifying one or more target molecules in a sample. The studies, is also useful in genetic analysis, gene expression studies, identifying molecules which interact with a target molecule, detection/typing of single nucleotide polymorphisms, haplotyping and sequencing. The present DNA sequence represents a PCR primer that was

```
The internation of a performance animal. The method involves determining in sample abundance of expressed target nucleic acid; transmitting digital sample signal to remote diagnostic server; processing digital sample signal at remotely located database to correlate digital signal with digital information and returning report of particular condition of animal. The method is useful for assessing a condition of a performance animal preferably human, dog or camel. The condition can be an athletic ability and a condition that enhances, hinders, impedes or does not change an expected ability of the performance animal; and also normal, pre-clinical, overt progress and/or stage of disease, undiagnosed of unclassified conditions, presence of drugs, response to environmental conditions. Diseases nutritional states and response to environmental conditions. Diseases assessed by the invention include laminitis, lameless, viral or bacterial disease, gastritis, gastric ulcers, respiratory ailments, fractures, epistaxis, musculoskeletal damage or disorders and joint diseases. The presence is a primer used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

New microarray, comprising a matrix of cDNA probe from a set of probes immobilised to a solid surface in predetermined order, useful in the prognosis of patients with clear cell renal carcinoma
                                                         Microarray; solid surface; immobilised probe; CC-RCC; differential expression profile; aggressive CC-RCC tumour type; non-aggressive CC-RCC tumour type; clear cell renal carcinoma; gene expression profiling; tumour tissue; oligo-dT; primer; ss.
                                       Oligo-dT primer used in human CC-RCC invention.
                                                                                                                                                                                                                                                                                                        Example 2; Page 30; 179pp; English.
                                                                                                                                                                  29-MAR-2002; 2002WO-US09576.

Takashi M;

The present invention relates to a microarray comprising a matrix of at least one CDNA probe from a set of probes immobilised to a solid surface in a predetermined order, where a row of pixels corresponds to replicates of one distinct probe from the set. The probes are complementary to nucleic acid sequences that are expressed differentially in aggressive as compared to non-aggressive types of clear cell renal acarcinoma (CC-RCC) and that hybridise to the probes under high stringency conditions. The microarray is useful for the prognosis of patients with CC-RCC, wherein aggressive and non-aggressive CC-RCC tumour types are characterised by differential expression profiles of genes that hybridise with one or more probes immobilised on the microarray. The arrays are useful for gene expression profiling of tumour and normal tissues. The present sequence represents an oligo-dT primer used in the examples of the Sequence 22 BP; 0 A; 0 C; 0 G; 20 T; 2 other; Query Match Best Local Similarity

3'-PCR primer used in method of identifying transcribed genes. (first entry)

Identification of transcribed gene; mRNA profile; gene expression; cellular process; fingerprinting; susceptibility to external factor; development; disease; PCR; primer; ss.

mRNA molecules present in a sample. The method comprises generating two independent patterns characteristic of the population of mRNA molecules present in a sample and analysing the patterns of mRNA molecules expressed in the sample and analysing the patterns using a combinatorial algorithm, comparing gene expression by different or same cell types under different conditions, and identifying genes having a role in various cellular processes. The method is useful for the analysis and identification of transcribed genes, and fingerprinting. The method can be used to identify genes which play a role in determining various cellular processes. Including susceptibility to external factors, development, and disease. The present sequence for a PCR primer is used in the methods of the present invention. comparing Providing mRNA profile, by generating two independent patterns characteristic of sample mRNA population, analysing patterns, comparing gene expression by cell types under varied conditions, and identifying present invention relates to a method for providing a profile Seguence 23 BP; 0 A; 0 C; 0 G; 20 T; 3 other; Bauren G; Example 2; Page 45; 67pp; English. 21-JUL-2000; 2000GB-0018016. 21-JUL-2000; 2000US-219925P. 23-JUL-2001; 2001WO-IB01539. The invention relates to the polypeptide DNA topoisomerase II (TOP2) 21.34, a polymucleotide encoding the polypeptide and a method for producing the polypeptide by DNA recombination technology. The polypeptide is used for curing several diseases, such as malignant polypeptide is used for curing several diseases, such as malignant twincurs, haemopathy, development disturbance, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. This sequence represents a reverse transcriptase PCR (RT-PCR) primer used in isolation of CDNA encoding DNA topoisomerase II (TOP2) 21.34.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel human actin similar protein 56.43, polymocleotides encoding the polypeptide and a DNA recombination process to produce the polypeptide. The present invention also discloses the method of applying the polypeptide in treating various diseases, such a periodic palsy, arrhythmia, bronchial asthma, peptic ulcer, diabetes, tumours, etc. The present invention also discloses the antagonist resisting the polypeptide and its treatment effect. This sequence represents a RT-PCR primer used in the amplification of the human actin similar protein 56.43 described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                   actin similar protein 56.43; palsy; arrhythmia; bronchial asthma; ulcer; diabetes; tumour; PCR; primer; ss.

The invention relates to an isolated polypeptide with aminopeptidase activity and the gene encoding it (including sequences complimentary to the gene and which hybridise to it at high stringency), from Aspergillus niger. Also included are a nucleic acid construct comprising the above miger. Also included are a nucleic acid construct comprising the above for direct the production of the polypeptide in a suitable expression host, a recombinant expression vector comprising the above uncleic acid construct, a recombinant host cell comprising the above construct or recombinant host cell to produce a supernatant and/or cells comprising the polypeptide and recovering the polypeptide. The aminopeptidase is consect to prepare a food composition such as dough to enhance the flavour. The invention provides a bacterial enzyme for protein aperdous is in with aminopeptidase activity, to produce flavouring a previously observed weak aminopeptidase activity which was detected a protein and appropriate or latentification is latent and a produce flavouring a previously observed weak aminopeptidase activity which was never isolated or identified. The use of erzymes to produce flavouring agents from proteinaceous material is better than use of strong acids which is a reverse transcriptore of the amino acids obtained. The present sequence is intron-error error. intron-exon structure of the aminopeptidase gene.

Human alkylation-DNA-protein cysteine methyltransferase and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation -

Example 2; Page 19; 40pp; Chinese.

The present invention relates to human alkylation-DNA-protein cysteine methyltransferase (see AAM47739). The protein and its coding sequence are useful in the diagnosis and treatment of malignant tumours, haemopathy, HIV infection, immunological diseases and various inflammations. The present sequence is a PCR primer, which was used in an example from the present invention.

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma)k-delta-N3'; where x = alabelled compound and/or a nucleotide with voluntary sequence; of alpha; beta, delta = thymine; n = natural number indicating the repetition of alpha; beta, delta = to N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for reproductive and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.
                                                                                                     Peptides having at least two new nucleotides

This invention describes a novel retroviral expression vector (A) containing DNA sequences (I) for packaging vector RNA and for cell-specific expression of proteins or peptides encoding by heterologous DNA (II). The sequences controlling cell-specific expression contain a Retroviral expression vector, useful in gene therapy, contains a promoter from a human endogenous retrovirus to provide cell-specific Disclosure; Page 27; 67pp; German.

CC cell-specifically regulatable promoter region (P) from a human endogenous retrovirus (HBRV) DNA sequence. The invention also describes (a) mRNA and cell (A); (b) prokaryotic and eukaryotic cells containing (A); (c) and containing a retroviral expression vector RNA derived from (A); (e) a method for producing the virions of (d); (f) a method for incorporating containing a retroviral expression vector RNA derived from (A); (e) a method for producing the virions of (d); and (g) a retroviral vector system infection with the virions of (d); and (g) a retroviral vector system containing (A) and a packaging cell line, that contains at least one proteins of (A). (A) are used for cell- or tissue-specific expression of cereominant) retrovirus construct that encodes for the packaging for introducing or proteins of (A). (A) are used for cell- or tissue-specific expression of (I) into the enromesomal DNA of eukaryotic cells, preferably mammalian consorted for encomesomal DNA of eukaryotic cells, preferably mammalian consorted such as equired for transcription in a consorted such consorted for transcription in a consorted such and limited cell specificity). Since (A) are derived from endogenous (harmless) viral sequences, they do not introduce any new types of retrovirus. The promoters provide cell or tissue specific 8888888888888888888888888888888888

Preparation of mixed backbone cligomeric compounds useful as e.g. primers for diagnostic tests, involves oxidation of H-phosphonate internucleoside linkages to phosphodiester internucleoside linkages

=

```
The present sequence is that of a phosphorothicate oligonuclectide containing 20 T nucleobases, each having a 2' methoxyethoxy group on its 5' ribbayl sugar moiety. It is an example of an oligomeric compound produced according to the methods of the invention. The mixed backbone oligomeric, or chimeric, compounds having phosphorothicate and/or phosphoramidate internucleoside linkages in addition to phosphorothicate and/or phosphoramidate internucleoside linkages. The methods utilise H-phosphorate internucleoside linkages. The methods utilise H-phosphorate internucleoside linkages. The methods utilise H-phosphorate internucleoside linkages. Bach internucleoside linkages prior to further elongation. Mixed contiguous regions is subsequently oxidized to phosphodiseter, internucleoside linkages prior to further elongation. Mixed contiguous regions is subsequently oxidized to phosphodiseter, internucleoside linkages prior to further elongation. Mixed backbone oligomeric compounds are prepared in this manner by compounds of the invention are prepared using novel oxidation steps chat oxidized a region of 1 or more H-phosphonate internucleoside had oxidized. The oligomucleotides obtained are useful as primers in PCR, probes, linkages that have been primers in PCR, probes, linkers, gene fragments and for other primers in PCR, probes, linkers, gene fragments and for other cresarch reagents, and as antiviral agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 17 BP; 0 A; 0 C; 0 G; 17 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides. They are used in a method for detecting an antigen in a subject. The method involves binding the antigen to a solid support and then reacting it with an immunoreactive ligand (L) bound to an oligo, removing any unreacted L, and then detecting the presence of the oligo. A similar method can be used to detect Abs, in which case the ligand is an oligo-labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab to be detected at very low levels. An exemplary olgi is AAQ75024 which can be covalently attached by the 5'-terminus to the N- or C-terminal of a synthetic peptide. In the example, peptide AAR62941 was coupled to oligo AAQ75024 using

They were used to prime cDNA synthesis from snapdragon (Antirrhinum majus) petal and leaf RNA, and were also utilised in the PCR amplification of plant cytochrome P450 sequences (see also AAT94670-73). A cDNA clone (see using a differential display approach. This can be used to
disuccinimidyl suberate. Serum samples suspected to contain HEV Abs were immobilised on plastic tubes or wells, then incubated for 30-60 onins with the peptide-oligo proruct. The vessels were washed; bound oligo was released with 0.2M glycine and amplified in a separate tube using as primers AAQ75025 and AAQ75026 in 30 cycles of PCR. The glycoslase to remove the U18 fragment, and the product captured by immobilised oligo-dT.
                                                                                                                                                                                                                                                                                                                                                                                                Gaps

This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Anchored poly(T) oligonucleotides polyT-anchA (AAT94667), polyT-anchC (AAT94668) and polyT-anchG (AAT94669) are complementary to the upstream region of a polyadenylation sequence. They were used to prime cDNA sythesis from snapdragon (Antirrhinum majus) petal and leaf RNA, and were also utilised in the PCR amplification of plant cytochrome P450 sequences (see also AAT94670-73). A cDNA clone (see AAT94657) encoding flavonoid 3' hydroxylase (see AAM35704) was isolated using a differential display approach. This can be used to manipulate the pigmentation of transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to an analytical method for determining the mucleotide sequence of nucleic acid analytes, including chemically modified oligonucleotides. This new method utilises electrospray instainon-Fourier transform mass spectrometry. The ions are excited by sustained off-resonance excitation with single shot excitation, and the target fragmented by collisionally activated dissociation by a neutral gas, e.g. carbon dioxide. Alternatively, the excitation and dissociation of biology and biomedical application. The method is used in molecular biology and biomedical applications. The method is used in molecular constance transform ion cyclotron resonance mass spectrometry, is extremely rapid and acts directly on the oligonucleotide. The method is effective for a variety of nucleic acid analytes, particularly chemically modified oligonucleotides which have not previously been successfully sequenced. The present sequence represents a
                    sequence of a nucleic acid analyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 18 BP; 17 A; 0 C; 0 G; 1 T; 0 other;

New secreted proteins and associated polynucleotides - obtained from murine adult spleen, human foetal kidney, human ovary, murine bone marrow and murine adult thymus

Disclosure; Page 58; 75pp; English.

The present invention describes novel proteins isolated from cDNA clones: AE648_11; AE693_11; AK438_11; AK609_11; AM1060_11; AQ2_11;

K433_11; or L256_11, deposited as ATCC 98237. The present sequence represents the 37-portion of AQ2_11 isolated from a human ovary cDNA library. The proteins from the present invention may be administered in a composition to prevent, treat or ameliorate a medical condition. The proteins may exhibit biological activities such as nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating or suppressing activity, haematopoiesis regulating chemotactic/chemokinetic activity, haematopoiesis regulating chemotactic/chemokinetic activity, haematopoiesis and thrombotic activity, receptor/ligand activity, humbition activity, receptor/ligand activity, tumour inhibition activity, and other

Treating bacterial infections in humans or animals with oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial nucleic acid or proteins, also conjugates of these oligo:nucleotide(s) with antibiotics

Claim 49; Page 87; 163pp; English.

This antisense oligonucleotide is nuclease resistant and can be used in the treatment of animals, including humans, having a bacterial infection. The treatment comprises administration of such nuclease resistant oligonucleotides, targeted to a nucleic acid or protein of the bacterium, and formulated with a carrier. A compound comprising this nuclease resistant oligonucleotide can be covalently linked to an antibiotic. The method is used to treat infections by a wide variety of Gram-positive and Gram-negative, or acid-fast, bacteria, in human and veterinary medicine. The methods are particularly used in immuno-compromised individuals (e.g. patients with acquired immunodeficiency syndrome or those receiving chemotherapy or radiation therapy), optionally in combination with, or

fused to, antiviral or other antimicrobial oligonucleotides. Apart from therapeutic use, the oligonucleotides can be used to control bacteria in laboratory cultures, foods, beverages and industrial processes. The oligonucleotides are specific for bacteria, without affecting metabolism in mammalian cells. They may also activate RNase H and have a general, non-specific immune-stimulating effect. The oligonucleotides can be administered orally, intransally, rectally, topically or by injection, optionally coupled to an agent (e.g. carbohydrate or polyamine) that enhances cellular uptake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method has been developed for labelling an oligonucleotide having a adenine and thymine or uxacil or guanine and vivosine, and n is an integer of lor more ) at the 3'-terminal side in which the repeated sequence is added and extended using a labelled body of the nucleotide constituting the repeated sequence and a DNA. polymerase lacked in 5' to The method can detect a gene in a sensitivity up to ten times higher than prior art methods. The present sequence represents a primer used than prior art methods. The present sequence represents a primer used

A method has been developed for labelling an oligonucleotide having a repeated sequence of (XY)n (where X and Y consists of a combination of adenine and thymine or uracil or guanine and cytosine, and n is an integer of 1 or more ) at the 3'-terminal side in which the repeated sequence is added and extended using a labelled body of the nucleotide constituting the repeated sequence and a DNA polymerase lacked in 5' to 3' exonuclease activity. The method can be used for detecting a gene. The method can detect a gene in a sensitivity up to ten times higher than prior art methods. The present sequence represents a primer used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.

The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperricemia and sleep apnea syndrome. The genes (AAZ20631-633) and the proteins (AAZ5059-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose
           This invention describes novel secreted human proteins (I) which have cytostatic, immunostimulatory, antimicrobial, antiviral, immunostimulatory, antimicrobial, antiviral, immunosuppressive, antiminflammatory and vulnerary activity and which at as cytokine, cell proliferation or differentiation regulators. (I) is useful for treating tumors, autoimmune diseases, inflammatory disorders, wounds, microbial infections and viral diseases. (I) is also useful for suppressing graft versus host reaction. AAA40490-A40580 represent cDNA fragments that encode the secreted proteins AAB10226-B10288 described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Adipose tissue; obesity; diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
                                                                                                                                                                                                    This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X) m5. (alpha)n-beta-N3. or (X) m5. (gammalk-delta-N3.; where
X = a labelled compound and/or a nucleotide with voluntary sequence;
m = 0 or 1; alpha = thymine; n = natural number indicating the repetition
A alpha; bera, delta = v or Ni, v = adenine, gamma = thymine or cytosine;
N = adenine, quanine, cytosine or thymine; gamma = thymine;
k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for FT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Secreted human proteins AS296-1i and AS34-1i, useful for treating tumors, autoimmune diseases, inflammatory disorders, wounds, microbial infections and viral diseases -

The invention relates to a new composition for selective, sequence-
specific inhibition of gene transcription and expression in a host. The
composition comprises eligonuclectides centablings expaints that
can hybridise to either a single-stranded (ss) RNA to induce RNase H
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
belix, thereby inhibiting DNA replication and/or transcription. The
oligoarabinonuclectides are used for antisense inhibition of gene
expression or to prevent DNA replication, or reverse transcription of
expression or to prevent DNA replication, or reverse transcription of
inhibit retroviruses. The compositions are therefore particularly used to
inhibit retroviruses. The compositions are therefore particularly used to
inhibit retroviral replication. The oligoarabinonuclectides can also be
used, in combination with RNase H, as reagents for sequence-specific
cleavage or RNA mapping, and additionally for the study and control of
gene expression in cells. The oligoarabinonuclectides have excellent
affinity for RNA, increased resistance to nucleases and show little if
any non-specific binding to cellular or serum proteins They target ss
RNA, but not complementary ss DNA, so may be useful for targeting
retroviral genomic RNA to inhibit the early stages of viral replication.
Oligoarabinonuclectides containing pyrimidine bases form triple helices
with significantly higher thermal stability than those produced by
commal oligomuclectides containing beta-D-arabinose used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Therapeutic composition containing antisense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication

Example 1; Page 29; 91pp; English.

The invention relates to a new composition for selective; sequence—
specific inhibition of gene transcription and expression in a host. The
composition comprises oligonuclectides containing arabinose sugars that
can hybridise to either a single-stranded (ss) RNA to induce RNase H
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
helix, thereby inhibiting DNA replication and/or transcription. The
oligoarabinonuclectides are used for antisense inhibition of gene
expression or to prevent DNA replication, or reverse transcription of
RNA by retroviruses. The compositions are therefore particularly used to
inhibit retroviruse. The compositions are therefore particularly used to
inhibit retrovirus replication. The oligoarabinonuclectides can also be
used, in combination with RNase H, as reagents for sequence-specific
cleavage or RNA mapping, and additionally for the study and control of
gene expression in cells. The oligoarabinonuclectides have excellent
affinity for RNA, increased resistance to nucleases and show little if
any non-specific binding to cellular or serum proteins. They target ss
RNA, but not complementary ss DNA, so may be useful for trargetting
retroviral genomic RNA to inhibit the early stages of viral replication.
Oligoarabinonuclectides containing pyrimidine bases form triple helices
with significantly higher thermal stability than those produced by
normal oligonuclectides. Sequences AAZ87160-Z87164 represent
oligoarabinouclectides containing beta-D-arabinose used in an exemplification of the present invention.

The invention relates to a new composition for selective, sequence—
Specific inhibition of gene transcription and expression in a host. The composition comprises oligonucleotides containing arabinose sugars that can hybridise to either a single-stranded (ss) RNA to induce RNase H cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple helix, thereby inhibiting DNA replication and/or transcription. The oligoarabinonucleotides are used for antisense inhibition. The oligoarabinonucleotides are used for antisense inhibition of gene expression or to prevent DNA replication, or reverse transcription of mibit retroviruses. The compositions are therefore particularly used to inhibit retroviruses. The compositions are therefore particularly used to inhibit retrovirus a replication. The oligoarabinonucleotides can also be used, in combination with RNase H, as reagents for sequence-specific cleavage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligoarabinonucleotides have excellent affinity for RNA, increased resistance to nucleases and show little if any non-specific binding to cellular or serum proteins. They target as the complementary as DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal oligonucleotides. Sequences AAZSH169 represent on a rabinose used in an exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Therapeutic composition containing antisense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                       a

The invention relates to a new composition for selective, sequence-specific inhibition of gene transcription and expression in a host. The composition comprises oligonuclecties containing arabinose sugars that can hybridise to either a single-stranded (ss) RNA to induce RNase H cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple helix, thereby inhibiting DNA replication and/or transcription. The oligoarabinonucleotides are used for antisense inhibition of gene expression or to prevent DNA replication, or reverse transcription of RNA, by retroviruses. The compositions are therefore particularly used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inhibit retroviral replication. The oligoarabinouncleotides can also be used, in combination with RNase H, as reagents for sequence-specific claravage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligoarabinonucleotides have excellent affinity for RNA, increased resistance to nucleases and show little if any non-specific binding to cellular or serum proteins. They target ss RNA, but not complementary as DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal oligouncleotides. Sequences AA287165-287169 represent containing 2'-deoxy-2'fluoro-beta-D-arabinose used in an exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Therapeutic composition containing antisense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication

The invention provides methods for amplification and detection of RNA derived from a population of cells, preferably eukaryotic cells and most preferably mammalian cells, which methods preserve fidelity and most preferably mammalian cells, which methods preserve fidelity with anable amplification of extremely small amounts of mRNA. The method and kit are useful for amplifying and detecting RNA derived from a population of cells, especially eukaryotic cells like mammals. The RNAs generated are useful for profiling gene expression in different populations of cells. The present sequence is a mRNA fragment used in 3' end PCR/IVT (in vitro transcription) method of the invention.
                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                    RNA polymerase; RNAP; RNA detection; IVT; in vitro transcription; ss.

The present sequence corresponds to polylinker DNA of the phagemid vector pCR2.1. It was used in the construction of a normalised rat CDNA library, which was used in an example demonstrating differential expression of a rat gene referred to as clone P00210D09. The invention clates to a polypeptide comprising a sequence of at least 80% identity to residues 22-122 of the present sequence, or a sequence encoded by a nucleic acid hybridising under stringent conditions to the complement of the coding region comprising 1031 nucleotides, and having at least one polypeptides and polymospide encoded by clone P00210D09. The polypeptides and polymospide encoded by clone P00210D09. The polypeptides and polymospide of the invention are useful for the polymospides are useful in antisense mediated gene inhibition and in gene therapy. The polypeptides are useful in assays for identifying lead compliant may be used as therapoutic agents in the treatment of

The patent discloses novel secreted factor protein encoded by clone pounds D12. The secreted factor is differentially expressed in certain discase states. Secreted protein, its antibodies, antagonists or compositions comprising them are useful in the diagnosis and treatment of cardiac diseases such as congestive heart failure, myocardial infeation, cardiac arrhythmia, arteriosclerosis, myocardial infarction, cardiac arrhythmia, arteriosclerosis, kidney diseases such as acute renal failure, renal glucosuria, renal infarction, nephroganic diabetes inspipulas, polyoyatic kidney disease, hereditary nephritis and inflammatory diseases such as sethma, autoimmune diabetes, tumour angiogenesis, rheumatoid arthritis, osteoarthritis, toxic shock syndome, sathma, stroke, neural trauma, psoriasis, cerebral malaria, osteoporosis, Crohn's disease, ulcerative colitis, Alzheimer's disease. Secreted protein DNA is useful in antisense-mediated gene inhibition and gene therapy. An array comprisaing one or more oligonucleotides complementary to reference RNA or DNA encoding the secreted factor is useful for detecting cardiac, kidney and inflammatory disease. The normalised cDNA library containing secreted factor buns. The normalised cDNA library containing secreted factor DNAs. The normalised cDNA library containing secreted factor of differentially expressed rat secreted factor P0188_D12 gene. Novel secreted factor encoded by clone P00188D12 which is differentially expressed in certain disease states, useful in diagnosing and treating cardiac, renal or inflammatory diseases Sequence 18 BP; 0 A; 0 C; 0 G; 18 T; 0 other; Example 1; Page 42; 71pp; English.

Immunostimulatory nucleic acid #824.

```
The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. toxoplasma, retroviridae, and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a lact to a Th1 immune response and to activate immune cells.

Note: the present sequence may have a phosphorothioate backbone.
    anti-parasitic;
                                                                  88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids -

```
The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th1 immune response and to activate immune cells.
                                                                                                                                                                                                                                                                                                                                      Vaccinating against tumors, infectious diseases, allergies and asthmausing immunostimulatory \mathrm{Py}\text{-}\mathrm{rich} and TG nucleic acids -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ·;

                                                                                                                                                                                                                                                           The present invention relates to an array of proteins (antibody mimics comprising a fibronectin type III domain having a randomised loop, a randomised beta-sheet, or their combination, and has the capacity to bind to a compound that is not bound by a corresponding naturally-occurring fibronectin, immobilised onto a solid support. The antibody mimics is useful for detecting a compound preferably a protein, in a biological sample. It is also useful to detect one or more different analytes simultaneously in a sample. Hence is useful for diagnostic purposes. It is also useful for the purpose of designing proteins capable of binding to virtually any compound of interest. The present sequence is an oligonucleotide Al8-2PEG linker used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Angiogenesis inhibitor; ss, angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
